

# LAB-02

## TASK-01:

### 1. QUICK SORT(pivot at end)-

```
#include <iostream>
using namespace std;
int partition(int arr[],int low,int high){
    int pivot = arr[high];
    int i = low-1;

    for(int j= low; j<high ; j++){
        if(pivot>arr[j]){
            i++;
            swap(arr[i],arr[j]);
        }
    }
    swap(arr[i+1] , arr[high]);
    return i+1;
}
void quicksort(int arr[] , int low , int high){
    if(low<high){
        int pivot = partition(arr,low,high);

        quicksort(arr,low,pivot-1);
        quicksort(arr,pivot+1,high);
    }
}
void print(int arr[],int n){
    for(int i=0;i<n;i++){
        cout<<arr[i]<<" ";
    }
    cout<<endl;
}
int main(){
    int arr[5] = {3,1,5,6,2};
    int n = 5;
    print(arr,n);
    quicksort(arr,0,n-1);
    cout<<"Pivot at end: ";
    print(arr,n);
}
```

Output:

```
PS C:\Users\Ritik gupta\Desktop\Lab\DAA\Lab 2> cd "c:\Users\Ritik gupta\Desktop\Lab\DAA\Lab 2\"
}
3 1 5 6 2
Pivot at end: 1 2 3 5 6
PS C:\Users\Ritik gupta\Desktop\Lab\DAA\Lab 2> █
```

### 2. Quick Sort(pivot at first):-

```
#include <iostream>
using namespace std;
int partition(int arr[],int low,int high){
    int pivot = arr[low];
    int j = high;
    for (int i = high; i > low; i--) {
        if (arr[i] > pivot){
```

```

        swap(arr[i],arr[j]);
        j--;
    }
}
swap(arr[j],arr[low]);
return j;
}
void quicksort(int arr[] , int low , int high){
    if(low<high){
        int pivot = partition(arr,low,high);

        quicksort(arr,low,pivot-1);
        quicksort(arr,pivot+1,high);
    }
}
void print(int arr[],int n){
    for(int i=0;i<n;i++){
        cout<<arr[i]<<" ";
    }
    cout<<endl;
}
int main(){
    int arr[5] = {3,1,5,6,2};
    int n = 5;
    print(arr,n);
    quicksort(arr,0,n-1);
    cout<<"Pivot at start: ";
    print(arr,n);
}

```

Output:

```

PS C:\Users\Ritik gupta\Desktop\Lab\DAA\Lab 2> cd "c:\Users\Ritik gupta\Desktop\Lab\DAA\Lab 2\" ; i
}
13 1 15 6 2
Pivot at start: 1 2 6 13 15
PS C:\Users\Ritik gupta\Desktop\Lab\DAA\Lab 2> █

```

### 3.QuickSort(pivot at middle)

```

#include <iostream>
using namespace std;
int partition(int arr[],int low,int high){
    int mid = (low + high)/2;
    int pivot = arr[mid];
    swap(arr[mid] , arr[high]);
    int i = low;

    for(int j= low; j<high ; j++){
        if(pivot>arr[j]){

            swap(arr[i],arr[j]);
            i++;
        }
    }
    swap(arr[i] , arr[high]);
    return i;
}
void quicksort(int arr[] , int low , int high){
    if(low<high){
        int pivot = partition(arr,low,high);

        quicksort(arr,low,pivot-1);
    }
}

```

```

        quicksort(arr,pivot+1,high);
    }
}
void print(int arr[],int n){
    for(int i=0;i<n;i++){
        cout<<arr[i]<<" ";
    }
    cout<<endl;
}
int main(){
    int arr[5] = {3,1,5,6,2};
    int n = 5;
    print(arr,n);
    quicksort(arr,0,n-1);
    cout<<"Pivot at end: ";
    print(arr,n);
}

```

Output:

```

PS C:\Users\Ritik gupta\Desktop\Lab\DAA\Lab 2> cd "c:\Users\R
}
3 9 10 1 4
Pivot at middle: 1 3 4 9 10
PS C:\Users\Ritik gupta\Desktop\Lab\DAA\Lab 2> █

```

Time complexities:

Pivot	Start	Middle	End
Random	$n \cdot \log n$	$n \cdot \log n$	$n \cdot \log n$
Best	$n \cdot \log n$	$n \cdot \log n$	$n \cdot \log n$
Worst	$n^2$	$n^2$	$n^2$

#### 4.Decimal to Binary:

```

#include <bits/stdc++.h>
using namespace std;
void find_bin(int n){
    if(n==0){
        return ;
    }
    find_bin(n/2);
    cout<<n % 2;
}
int main(){
    int n;
    cout<<"Enter any number: ";
    cin>>n;
    int p=n;
    string binary = "";
    if (n == 0) {
        binary = "0";
    } else {
        while (n > 0) {
            binary = char('0' + (n % 2)) + binary;
            n /= 2;
        }
    }
    cout<<"Binary from loop: "<<binary<<endl;
    cout<<"Binary from Recursion: ";
}

```

```
find_bin(p);
```

```
}
```

Output:

```
PS C:\Users\Ritik gupta\Desktop\Lab\DAA\Lab 2> cd "c:\Users\Ritik gupta\Desktop\Lab\DAA\
}"
Enter any number: 22
Binary from loop: 10110
Binary from Recursion: 10110
PS C:\Users\Ritik gupta\Desktop\Lab\DAA\Lab 2> █
```

## Task-02

### 1.Number of Islands:

Description Accepted X Editorial Solutions Submissions

#### 200. Number of Islands

Solved

Medium Topics Companies

Given an  $m \times n$  2D binary grid `grid` which represents a map of '1's (land) and '0's (water), return the number of islands.

An **island** is surrounded by water and is formed by connecting adjacent lands horizontally or vertically. You may assume all four edges of the grid are all surrounded by water.

Example 1:

```
Input: grid = [
  ["1","1","1","1","0"],
  ["1","1","0","1","0"],
  ["1","1","0","0","0"],
  ["0","0","0","0","0"]
]
Output: 1
```

Code

C++ v Auto

```
2 public:
3     void island(vector<vector<char>>& grid, int i, int j, int row, int col) {
4         if(i<0 || j<0 || i>=row || j>=col || grid[i][j] == '0') return;
5         grid[i][j] = '0';
6         island(grid,i+1,j,row,col);
7         island(grid,i,j+1,row,col);
8         island(grid,i-1,j,row,col);
9         island(grid,i,j-1,row,col);
10    }
11
12    int numIslands(vector<vector<char>>& grid) {
13        int row = grid.size();
14        int col = grid[0].size();
15        int count = 0;
16        for(int i = 0; i < row; i++) {
17            for(int j = 0; j < col; j++) {
18                if(grid[i][j] == '1') {
19                    island(grid,i,j,row,col);
20                    count++;
21                }
22            }
23        }
24        return count;
25    }
```

### 2.Merge 2 sorted array

## 88. Merge Sorted Array

Solved

Easy Topics Companies Hint

You are given two integer arrays `nums1` and `nums2`, sorted in **non-decreasing order**, and two integers `m` and `n`, representing the number of elements in `nums1` and `nums2` respectively.

**Merge** `nums1` and `nums2` into a single array sorted in **non-decreasing order**.

The final sorted array should not be returned by the function, but instead be *stored inside the array* `nums1`. To accommodate this, `nums1` has a length of `m + n`, where the first `m` elements denote the elements that should be merged, and the last `n` elements are set to `0` and should be ignored. `nums2` has a length of `n`.

</>Code

C++ Auto

```
1 class Solution {
2 public:
3     void merge(vector<int>& nums1, int m, vector<int>& nums2, int n) {
4         int first = m-1;
5         int second = n-1;
6         int idx = m+n-1;
7         while(second>=0){
8             if(first>=0 && nums1[first] > nums2[second]){
9                 nums1[idx--] = nums1[first--];
10            }
11            else{
12                nums1[idx--] = nums2[second--];
13            }
14        }
15    }
```

## 3.Length of last word

## 58. Length of Last Word

Solved

Easy Topics Companies

Given a string `s` consisting of words and spaces, return *the length of the last word in the string*.

A **word** is a maximal **substring** consisting of non-space characters only.

Example 1:

Input: `s = "Hello World"`

</>Code

C++ Auto

```
1 class Solution {
2 public:
3     int lengthOfLastWord(string s) {
4
5         int count=0;
6         int i = s.length()-1;
7         while (i >= 0 && s[i] == ' ') i--;
8         while(i >= 0 && s[i] != ' '){i--;count++;}
9
10        return count;
11    }
12 };
```
